TREAT SYSTEMS SERVICES AND QUALIFICATIONS

- HIGH PERFORMANCE TEAM

Treat Systems is a dynamic and innovative Danish SMV focused on developing certified healthcare software solutions including decision support, machine learning (ML) and artificial intelligence (AI). Our key clinical focus areas are within infectious diseases, microbiology, antibiotic therapy and antibiotic resistance.

- Decision support
- Physiological models
- Machine learning
- Scientific connections to Universities
- Cost-benefit analysis
- Artificial intelligence
- Causal probabilistic (Bayesian) networks

Modelling

- Infectious diseases
- Workflow analysis
- Microbiological and pathological understanding
- Clinical Trails
- Antimicrobial Stewardship
- Sepsis
- Infection control and surveillance

Clinical understanding

- ISO 13485 – Quality Management System
- ISO 62304 – Software life-cycle processes
- ISO 14971 – Risk Management
- ISO 27001 – Information security
- ISO 27701 – Privacy
- ISO 62366 – Usability
- ISO 14155 – Clinical Investigation

Regulatory compliance

- Multi language programming (C#, Angular, C++, JAVA, VBA)
- Web based technologies
- SQL or InterSystems Caché database structure
- Integration to hospital systems e.g. HL7 or FHIR
- Statistical analysis (SPSS, R, Excel, Matlab)

Technologies

KEY TECHNOLOGIES

WE HAVE FALLEN IN LOVE WITH BAYESIAN NETWORKS AND COST-BENEFIT

Artificial intelligence (AI)

Machine Learning

Deep Learning

- Deep Neural Network (DNN)
- Convolutional Neural Network (CNN)
- Artificial neural networks
- Decision trees
- Support vector machines
- **Bayesian networks**
- Genetic algorithms
- Reasoning
- Knowledge representation
- Planning
- Learning
- Natural language processing
- Perception
- **Cost-benefit**

AVOID BLACK BOX MODELLING

- TRADEOFF BETWEEN PERFORMANCE AND TRANSPARENCY

- ❑ The disadvantage of advanced AI models is that it can be difficult for humans to see how the model has arrived at a given outcome.

You should use visual graphic that supports interpretation of the algorithm's results

BACKGROUND

- PREHOSPITAL MEDICAL RECORDS GIVE AN OPPORTUNITY FOR EARLY IDENTIFICATION BEFORE ARRIVAL AT THE EMERGENCY DEPARTMENT

❑ Rapid identification and appropriate antibiotic treatment is the single most important intervention in treating sepsis

- Subtle signs and symptoms
- Don't wait until the patient is hypotensive!

❑ Scores are a common feature in sepsis assessment

- qSOFA/SOFA are part of the latest definitions
- Many publications of ML scores for early identification/severity assessment

AIM: With electronic prehospital medical records, can risk-stratification start prior to ED arrival?

Can existing scores be used and can we do better with ML?

COLLECTING CLINICAL DATA

- USE WHAT IS ALREADY AVAILABLE

- ❑ All ambulances in Denmark are equipped with devices to collect data in an electronic prehospital medical record (amPHI) which is automatically shared with the emergency department at the arrival hospital
 - ❑ Many clinical patient parameters are collected and documented automatically e.g. Blood pressure, pulse, blood saturation and ECG – very different from hospital environment
 - ❑ For some critical patients <10% end tidal CO₂ (ETCO₂) and respiratory frequency (RF) are measured automatically
 - ❑ Electronic prehospital records present an opportunity to use this data for decision support – potential to guide diagnostic testing (e.g. POCT), early treatment or interventions

OUR STUDY

-METHODS

❑ Patients

PMR data collected from Danish Regions for all prehospital journeys between 1 July 2016 and 31 December 2020.

❑ Data collected

All physiological variables (temperature, HR, systolic/diastolic BP, respiratory rate, O2 saturation, GCS and blood glucose).

❑ Outcomes

Positive blood culture, 30-day mortality and ICU admission

❑ Comparators

Standard vital-sign-based clinical triage scores – qSOFA, DEPT (Danish Emergency Process Triage), NEWS2, RETTS

❑ Data preparation

After cleaning and arranging the data (combining variables, converting to timeslices), data were split into training (2017-2019) and test (2020) sets

MACHINE LEARNING (ML) MODEL DEVELOPMENT

-BASIC MODEL DEVELOPMENT STEPS

Using training data

- Exploratory data analysis – investigate links between variables and to outcomes
- Feature engineering - identify new features (combinations/transformations)
- Feature selection
- Model selection – tuning/optimization of model parameters

Using test data

- Model assessment – visualization and interpretation of the results

FACTORS INFLUENCING PATIENT OUTCOMES - CHARLSON

MORTALITY BY ICD10 CODE GROUP

SURVIVAL CURVES, STRATIFIED BY NUMBER OF VISITS IN THE LAST 365 DAYS

RESULTS AND PERFORMANCE

- A MORE PRECISE ESTIMATE OF THE SEVERITY OF THE PATIENTS CAN BE FOUND VIA ADVANCED DECISION SUPPORT

30-day mortality

Positive BC

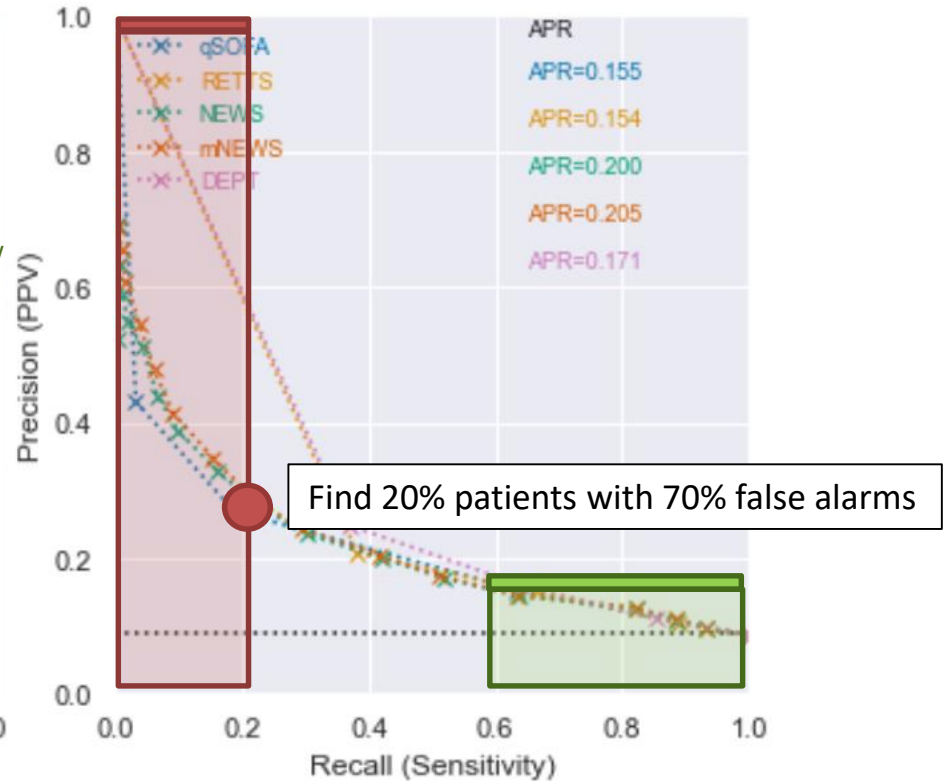

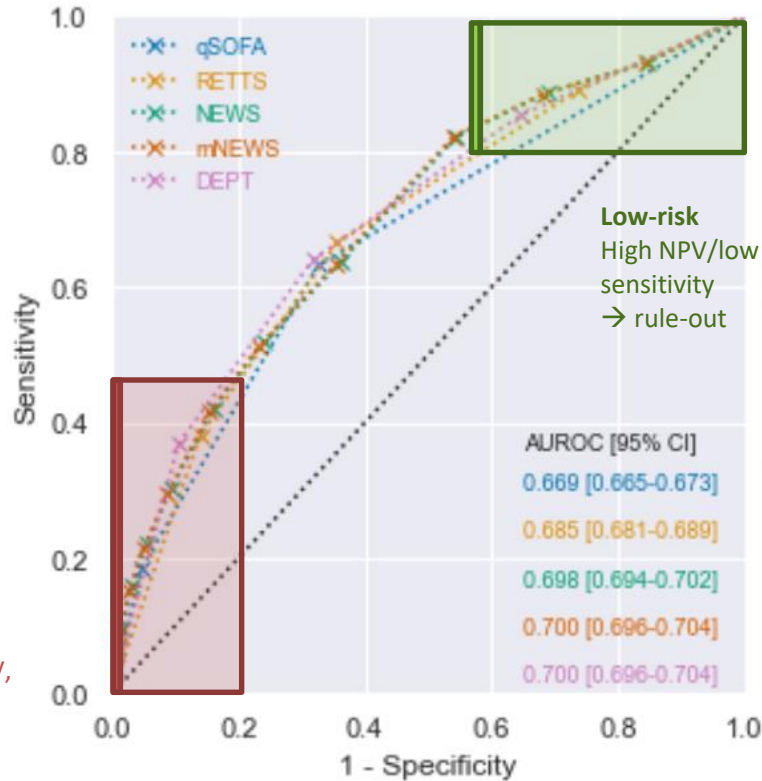

ICU admission

RESULTS AND PERFORMANCE – 30-DAY MORTALITY

- TO UTILIZE THE IMPROVED PREDICTIONS, OPERATING POINTS MUST BE CHOSEN TO GUIDE INTERVENTION VIA ADVANCED DECISION SUPPORT

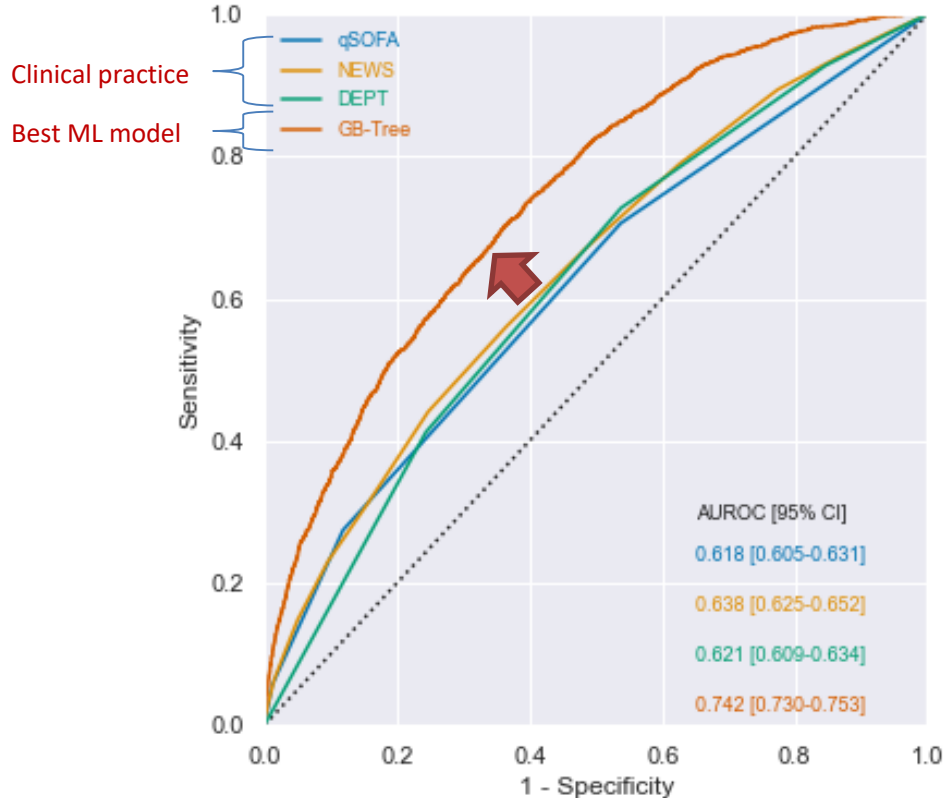

RESULTS AND PERFORMANCE – 30-DAY MORTALITY

- TO UTILIZE THE IMPROVED PREDICTIONS, OPERATING POINTS MUST BE CHOSEN TO GUIDE INTERVENTION VIA ADVANCED DECISION SUPPORT

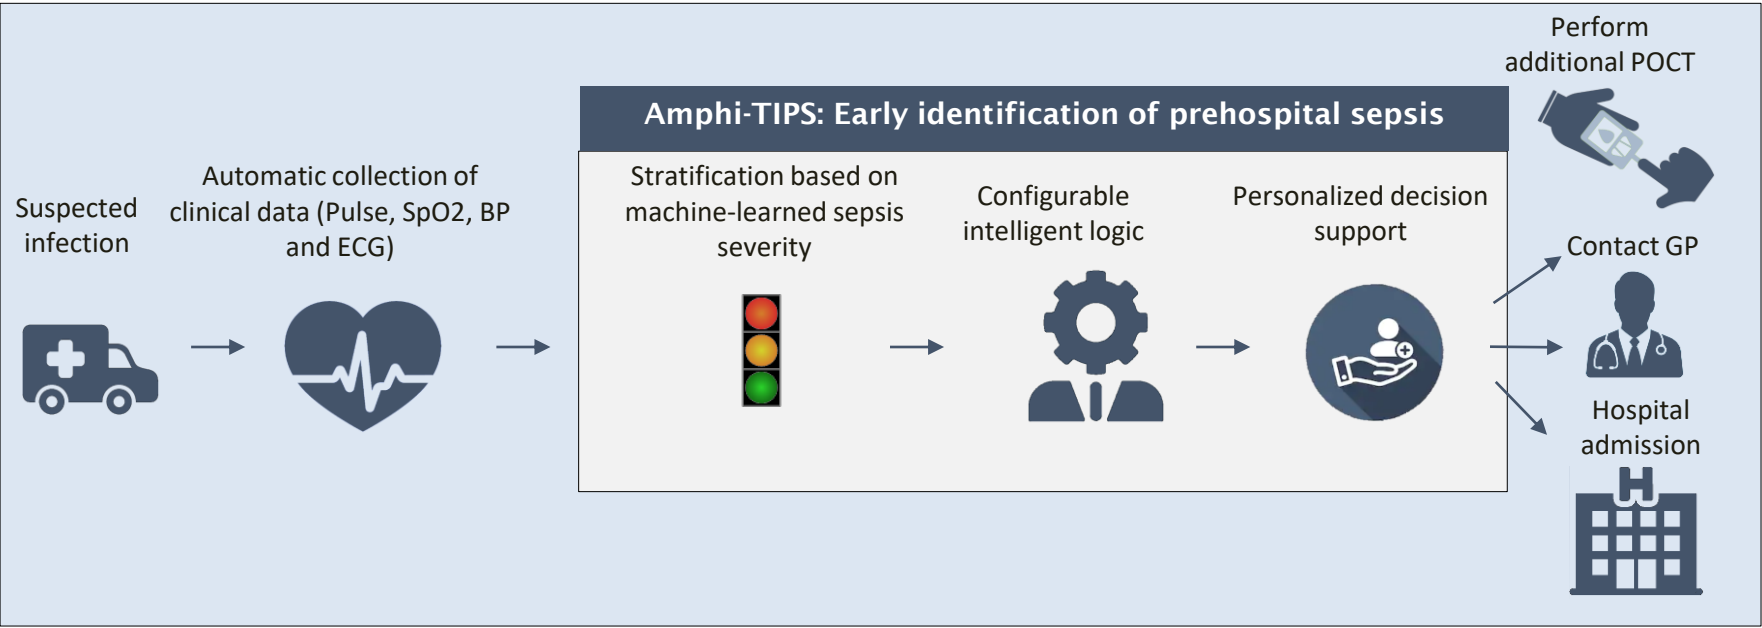

Although ML models perform significantly better than the baseline models there is no magic-bullet cut-off with high sensitivity AND high specificity, PPV.

→ Choose operating points to stratify patients into risk groups

APPLICATIONS/FUTURE WORK

- DECISION SUPPORT UNIFIES PERSONALIZED MEDICINE, MACHINE LEARNING, ARTIFICIAL INTELLIGENCE AND CLINICAL PRACTICE

SUMMARY

- TAKE HOME MESSAGES

- ✓ **Data is collected and is already collected in the ambulances**
... why not use this gold mine to automate the clinical workflow using decision support?
- ✓ **The ML models perform significantly better than the baseline models (clinical practice)**
... However, precision remains low with large numbers of false positives
- ✓ **Potential benefits from use of ML in prehospital risk, but further investigation required**
... e.g. prospective trial of additional POC test for high risk/safety of low-risk patients

CAUSAL PROBABILISTIC NETWORK (BAYSIAN NETWORKS)

THE BEAUTY OF CAUSALITY

Compile/Run mode

Enter evidence

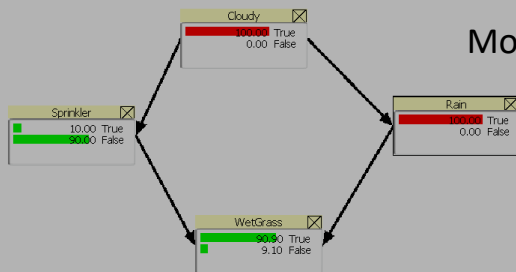

Bayes Formula

$$P(A | B) = \frac{P(B | A) \cdot P(A)}{P(B)}$$

A, B = events
 $P(A|B)$ = probability of A given B is true
 $P(B|A)$ = probability of B given A is true
 $P(A), P(B)$ = the independent probabilities of A and B
